Abstract

Using Jiang function we prove Jiang prime k -tuple theorem. We prove that the Hardy-Littlewood prime k -tuple conjecture is false. Jiang prime k -tuple theorem can replace the Hardy-Littlewood prime k -tuple conjecture.

Hardy-Littlewood 论文作为数论圣经，一百年来华罗庚、王元陈景润潘承洞和一大批数论家必读，他们是靠这篇文章起家的，这是当代最高数论水平，数学天才陶哲轩拼命在学习他们论文，下一步仔细研究他们论文，到底有多少猜想是正确的，素数太复杂，蒋春暄已打开素数大门。我们用正确和错误对比形式否定他们论文，一般数学家都能看懂。当代很多数学家获得很多数学大奖，很多结果是错的。一个小问题文章长到 100 页，不知他们在说什么？只有他们自己知道。

(A) Jiang prime k -tuple theorem [1, 2].

We define the prime k -tuple equation

$$p, p + n_i, \quad (1)$$

where $2|n_i, i = 1, \dots, k-1$.

we have Jiang function [1, 2]

$$J_2(\omega) = \prod_p (P - 1 - \chi(P)), \quad (2)$$

where $\omega = \prod_p P$, $\chi(P)$ is the number of solutions of congruence

$$\prod_{i=1}^{k-1} (q + n_i) \equiv 0 \pmod{P}, \quad q = 1, \dots, p-1. \quad (3)$$

If $\chi(P) < P-1$ then $J_2(\omega) \neq 0$. There exist infinitely many primes P such that each of $P + n_i$ is prime. If $\chi(P) = P-1$ then $J_2(\omega) = 0$. There exist finitely many primes P such that each of $P + n_i$ is prime. $J_2(\omega)$ is a subset of Euler function $\phi(\omega)$ [2].

If $J_2(\omega) \neq 0$, then we have the best asymptotic formula of the number of prime P [1, 2]

$$\pi_k(N, 2) = \left| \{P \leq N : P + n_i = \text{prime}\} \right| \sim \frac{J_2(\omega)\omega^{k-1}}{\phi^k(\omega)} \frac{N}{\log^k N} = C(k) \frac{N}{\log^k N} \quad (4)$$

$$\phi(\omega) = \prod_P (P-1),$$

$$C(k) = \prod_P \left(1 - \frac{1 + \chi(P)}{P}\right) \left(1 - \frac{1}{P}\right)^{-k} \quad (5)$$

Example 1. Let $k = 2, P, P+2$, twin primes theorem.

From (3) we have

$$\chi(2) = 0, \quad \chi(P) = 1 \quad \text{if } P > 2, \quad (6)$$

Substituting (6) into (2) we have

$$J_2(\omega) = \prod_{P \geq 3} (P-2) \neq 0 \quad (7)$$

There exist infinitely many primes P such that $P+2$ is prime. Substituting (7) into (4) we have the best asymptotic formula

$$\pi_k(N, 2) = \left| \{P \leq N : P+2 = \text{prime}\} \right| \sim 2 \prod_{P \geq 3} \left(1 - \frac{1}{(P-1)^2}\right) \frac{N}{\log^2 N}. \quad (8)$$

Example 2. Let $k = 3, P, P+2, P+4$.

From (3) we have

$$\chi(2) = 0, \quad \chi(3) = 2 \quad (9)$$

From (2) we have

$$J_2(\omega) = 0. \quad (10)$$

It has only a solution $P = 3, P+2 = 5, P+4 = 7$. One of $P, P+2, P+4$ is always divisible by 3.

Example 3. Let $k = 4, P, P+n$, where $n = 2, 6, 8$.

From (3) we have

$$\chi(2) = 0, \quad \chi(3) = 1, \quad \chi(P) = 3 \quad \text{if } P > 3. \quad (11)$$

Substituting (11) into (2) we have

$$J_2(\omega) = \prod_{P \geq 5} (P-4) \neq 0, \quad (12)$$

There exist infinitely many primes P such that each of $P+n$ is prime.

Substituting (12) into (4) we have the best asymptotic formula

$$\pi_4(N, 2) = \left| \{P \leq N : P + n = \text{prime}\} \right| \sim \frac{27}{3} \prod_{P \geq 5} \frac{P^3(P-4)}{(P-1)^4} \frac{N}{\log^4 N} \quad (13)$$

Example 4. Let $k = 5$, P , $P + n$, where $n = 2, 6, 8, 12$.

From (3) we have

$$\chi(2) = 0, \chi(3) = 1, \chi(5) = 3, \chi(P) = 4 \text{ if } P > 5 \quad (14)$$

Substituting (14) into (2) we have

$$J_2(\omega) = \prod_{P \geq 7} (P - 5) \neq 0 \quad (15)$$

There exist infinitely many primes P such that each of $P + n$ is prime. Substituting (15) into (4) we have the best asymptotic formula

$$\pi_5(N, 2) = \left| \{P \leq N : P + n = \text{prime}\} \right| \sim \frac{15^4}{2^{11}} \prod_{P \geq 7} \frac{(P-5)P^4}{(P-1)^5} \frac{N}{\log^5 N} \quad (16)$$

Example 5. Let $k = 6$, P , $P + n$, where $n = 2, 6, 8, 12, 14$.

From (3) and (2) we have

$$\chi(2) = 0, \chi(3) = 1, \chi(5) = 4, J_2(5) = 0 \quad (17)$$

It has only a solution $P = 5$, $P + 2 = 7$, $P + 6 = 11$, $P + 8 = 13$, $P + 12 = 17$, $P + 14 = 19$. One of $P + n$ is always divisible by 5.

蒋春暄最近才读以下论文，非常复杂，估计没有几个数学家能看懂。但他们结果到处引用。素数理论是计算问题。用他们方法计算结果都是错的。

(B) The Hardy-Littlewood prime k -tuple conjecture[3-11].

This conjecture is generally believed to be true, but has not been proved (Odlyzko et al. 1999).

We define the prime k -tuple equation

$$P, P + n_i \quad (18)$$

where $2 | n_i, i = 1, \dots, k-1$.

In 1923 Hardy and Littlewood conjectured the asymptotic formula

$$\pi_k(N, 2) = \left| \{P \leq N : P + n_i = \text{prime}\} \right| \sim H(k) \frac{N}{\log^k N}, \quad (19)$$

where

$$H(k) = \prod_P \left(1 - \frac{\nu(P)}{P} \right) \left(1 - \frac{1}{P} \right)^{-k} \quad (20)$$

$\nu(P)$ is the number of solutions of congruence

$$\prod_{i=1}^{k-1} (q + n_i) \equiv 0 \pmod{P}, \quad q = 1, \dots, P. \quad (21)$$

From (21) we have $\nu(P) < P$ and $H(k) \neq 0$. For any prime k -tuple equation there exist infinitely many primes P such that each of $P + n_i$ is prime, which is false.

(20) 和 (21) 是错误的, 一百年来数学家利用 (20) 和 (21) 得不出任何有用结果, 但是所有素数理论都要重复说明 (20) 式[4—11]。因为它是 Hardy 提出来的。所以一百年来素数研究没有得出任何有用结果, 都是在瞎猜。

Conjecture 1. Let $k = 2, P, P + 2$, twin primes theorem

Frome (21) we have

$$\nu(P) = 1 \quad (22)$$

Substituting (22) into (20) we have

$$H(2) = \prod_p \frac{P}{P-1} \quad (23)$$

Substituting (23) into (19) we have the asymptotic formula

$$\pi_2(N, 2) = |\{P \leq N : P + 2 = \text{prime}\}| \sim \prod_p \frac{P}{P-1} \frac{N}{\log^2 N} \quad (24)$$

which is false see example 1.

Conjecture 2. Let $k = 3, P, P + 2, P + 4$.

From (21) we have

$$\nu(2) = 1, \nu(P) = 2 \text{ if } P > 2 \quad (25)$$

Substituting (25) into (20) we have

$$H(3) = 4 \prod_{P \geq 3} \frac{P^2(P-2)}{(P-1)^3} \quad (26)$$

Substituting (26) into (19) we have asymptotic formula

$$\pi_3(N, 2) = |\{P \leq N : P + 2 = \text{prime}, P + 4 = \text{prime}\}| \sim 4 \prod_{P \geq 3} \frac{P^2(P-2)}{(P-1)^3} \frac{N}{\log^3 N} \quad (27)$$

which is false see example 2.

Conjecutre 3. Let $k = 4, P, P + n$, where $n = 2, 6, 8$.

From (21) we have

$$\nu(2) = 1, \nu(3) = 2, \nu(P) = 3 \text{ if } P > 3 \quad (28)$$

Substituting (28) into (20) we have

$$H(4) = \frac{27}{2} \prod_{P>3} \frac{P^3(P-3)}{(P-1)^4} \quad (29)$$

Substituting (29) into (19) we have asymptotic formula

$$\pi_4(N, 2) = |\{P \leq N : P + n = \text{prime}\}| \sim \frac{27}{2} \prod_{P>3} \frac{P^3(P-3)}{(P-1)^4} \frac{N}{\log^4 N} \quad (30)$$

Which is false see example 3.

Conjecture 4. Let $k = 5$, $P, P + n$, where $n = 2, 6, 8, 12$

From (21) we have

$$\nu(2) = 1, \nu(3) = 2, \nu(5) = 3, \nu(P) = 4 \text{ if } P > 5 \quad (31)$$

Substituting (31) into (20) we have

$$H(5) = \frac{15^4}{4^5} \prod_{P>5} \frac{P^4(P-4)}{(P-1)^5} \quad (32)$$

Substituting (32) into (19) we have asymptotic formula

$$\pi_5(N, 2) = |\{P \leq N : P + n = \text{prime}\}| \sim \frac{15^4}{4^5} \prod_{P>5} \frac{P^4(P-4)}{(P-1)^5} \frac{N}{\log^5 N} \quad (33)$$

Which is false see example 4.

Conjecutre 5. Let $k = 6$, $P, P + n$, where $n = 2, 6, 8, 12, 14$.

From (21) we have

$$\nu(2) = 1, \nu(3) = 2, \nu(5) = 4, \nu(P) = 5 \text{ if } P > 5 \quad (34)$$

Substituting (34) into (20) we have

$$H(6) = \frac{15^5}{2^{13}} \prod_{P>5} \frac{(P-5)P^5}{(P-1)^6} \quad (35)$$

Substituting (35) into (19) we have asymptotic formula

$$\pi_6(N, 2) = |\{P \leq N : P + n = \text{prime}\}| \sim \frac{15^5}{2^{13}} \prod_{P>5} \frac{(P-5)P^5}{(P-1)^6} \frac{N}{\log^6 N} \quad (36)$$

which is false see example 5.

Conclusion. The Hardy-Littlewood prime k -tuple conjecture is false. Jiang prime k -tuple theorem can replace Hardy-Littlewood prime k -tuple Conjecture. There cannot be really modern prime theory without Jiang function.

到今天中国不承认蒋春暄成果, 连蒋春暄母校北航不承认他是北航校友, 和中科院北大封杀蒋春暄成果。本文一公布就收到
Diego Rapoport 祝贺信,
The author would like to thank Walter Babin to publish this paper in general science journal。
因蒋春暄否定一大批数学家结果, 支持蒋春暄的桑蒂利也害怕从而也不发表蒋春暄的论文. 这篇文章应该是划时代的, 应该荣获世界数学最高奖, 但中国和

母校北航不支持。只能在网上发表让全世界所有人都能看到！
