

# The Failure of Black Holes to Explain Quasars

Jeffrey J Wolynski

March 8, 2013

Jeffrey.wolynski@yahoo.com

*Abstract: The scientific consensus, (religious dogma), that quasars are powered by super-massive black holes or black holes of any size is mathematically and observationally false.*

The consensus that quasars are powered by super-massive black holes is wrong because black holes do not exist as proven mathematically by Mr. Stephen Crothers.<sup>[1][2]</sup> Since black holes do not exist they can never “power” anything. This means that an actual explanation of the real mechanisms that power quasars is wide open, and that discovery as to the actual nature of these objects is open to amateurs and scientists who have not been brainwashed to believe in black holes. The author agrees with Mr. Halton Arp concerning them, as they probably eject from the location of active galaxies to become galaxies themselves.<sup>[3]</sup> It also should be mentioned that redshift as a determinate of quasar distance has also been falsified observationally by Mr. Halton Arp, as quasars are vastly closer than what the Big Bang Religion allows for.<sup>[4][5]</sup>
