

# Black Holes Theories

Nasir Germain and Jeffrey Wang

(Jeffrey Wang's theory) Black holes transports matter to other areas of the universe further explaining the big bang. As no "white holes" exist, the only explanation is that matter heats and compacts to be part of the outer universe. The light sucked in the black hole is used to heat and compact matter, and then mysteriously reappears outside of the universe. In between this process, fusion and fission will occur. Neutrinos and quasars will deform to become new matter (Nasir Germain does not agree with that). They form an illusion that they come out the black hole.

(Nasir Germain's theory)

The collision of quasars and black holes will cause the black hole to crumble on itself and its gravitational force will cause it to destroy itself.
