Abstract: Brown dwarfs, planets and stars are all the same objects in different stages of evolution. The mystery is solved.

The reader can see what a brown dwarf really is. A brown dwarf is a star in intermediate stages of evolution. It was a “star” and will become a “planet”. Thus stars, brown dwarfs and planets are the exact same objects just in different stages to their metamorphosis. This is blasphemy to the establishment so great care is needed. The reader will be called names and ridiculed or even fired for proposing this superior understanding to their overlords. This understanding will also be deleted from Wikipedia by the thought police. ^[4]
