*Abstract: According to mainstream dogma, white dwarfs have the mass of the Sun and the size of the Earth. This is mathematical fantasy. No experiment has ever proven the existence of matter denser than the element osmium. They are simply stars in regular stages of evolution, in-between blue stars and yellow stars. White dwarfs are very young stars which are hotter, bigger and brighter than the Sun's current stage of metamorphosis.*

The reader can see where white dwarfs really are. They are normal stars in normal stages of evolution,<sup>[1][2][3]</sup> not what the Wikipedia thought police think: densely packed degenerate matter with no internal heat source. <sup>[4]</sup> Thus the Chandrasekhar Limit has always been just a bunch of bogus math that has nothing to do with reality or physics.
