Taylor Series Approximation to Solve Neutrosophic Multiobjective Programming Problem

Abstract. In this paper, Taylor series is used to solve neutrosophic multi-objective programming problem (NMOPP). In the proposed approach, the truth membership, Indeterminacy membership, falsity membership functions associated with each objective of multi-objective programming problems are transformed into a single objective linear programming problem by using a first order Taylor polynomial series. Finally, to illustrate the efficiency of the proposed method, a numerical experiment for supplier selection is given as an application of Taylor series method for solving neutrosophic multi-objective programming problem at end of this paper.

Keywords: Taylor series; Neutrosophic optimization; Multiobjective programming problem.

1 Introduction

In 1995, starting from philosophy (when [8] fretted to distinguish between *absolute truth* and *relative truth* or between *absolute falsehood* and *relative falsehood* in logics, and respectively between *absolute membership* and *relative membership* or *absolute non-membership* and *relative non-membership* in set theory) [12] began to use the non-standard analysis. Also, inspired from the sport games (winning, defeating, or tie scores), from votes (pro, contra, null/black votes), from positive/negative/zero numbers, from yes/no/NA, from decision making and control theory (making a decision, not making, or hesitating), from accepted/rejected/pending, etc. and guided by the fact that the law of excluded middle did not work any longer in the modern logics. [12] combined the non-standard analysis with a tri-component logic/set/probability theory and with philosophy .How to deal with all of them at once, is it possible to unity them?[12].
Netrosophic theory means Neutrosophy applied in many fields in order to solve problems related to indeterminacy. Neutrosophy is a new branch of philosophy that studies the origin, nature, and scope of neutralities, as well as their interactions with different ideational spectra. This theory considers every entity <A> together with its opposite or negation <antiA> and with their spectrum of neutralities <neutA> in between them (i.e. entities supporting neither <A> nor<antiA>). The <neutA> and <antiA> ideas together are referred to as <nonA>.
Neutrosophy is a generalization of Hegel's dialectics (the last one is based on <A> and <antiA> only). According to this theory every entity <A> tends to be neutralized and balanced by <antiA> and <nonA> entities - as a state of equilibrium. In a classical way <A>, <neutA>, <antiA> are disjoint two by two. But, since in many cases the borders between notions are vague, imprecise, Sorites, it is possible that <A>, <neutA>, <antiA> (and <nonA> of course) have common parts two by two, or even all three of them as well. Hence, in one hand, the Neutrosophic Theory is based on the triad <A>, <neutA>, and <antiA>. In the other hand, Neutrosophic Theory studies the indeterminacy, labeled as I, with $I^n = I$ for $n \geq 1$, and $mI + nI = (m+n)I$, in neutrosophic structures developed in algebra, geometry, topology etc.
The most developed fields of Netrosophic theory are Neutrosophic Set, Neutrosophic Logic, Neutrosophic Probability, and Neutrosophic Statistics - that started in 1995, and recently Neutrosophic Precalculus and Neutrosophic Calculus, together with their applications in practice. Neutrosophic Set and Neutrosophic Logic are generalizations of the fuzzy set and respectively fuzzy logic (especially of intuitionistic fuzzy set and respectively intuitionistic fuzzy logic). In neutrosophic logic a proposition has a degree of truth (T), a degree of indeterminacy (I), and a degree of falsity (F), where T,I,F are standard or non-standard subsets of $]^-0, 1^+[$.

Multi-objective linear programming problem (MOLPP) a prominent tool for solving many real decision making problems like game theory, inventory problems, agriculture based management systems, financial and corporate planning, production planning, marketing and media selection, university planning and student admission, health care and hospital planning, air force maintenance units, bank branches etc.

Our objective in this paper is to propose an algorithm to the solution of neutrosophic multi-objective programming problem (NMOPP) with the help of the first order Taylor's theorem. Thus, neutrosophic neutrosophic multi-objective linear programming problem is reduced to an equivalent multi-objective linear programming problem. An algorithm is proposed to determine a global optimum to the problem in a finite number of steps. The feasible region is a bounded set. In the proposed approach, we have attempted to reduce computational complexity in the solution of (NMOPP). The proposed algorithm is applied to supplier selection problem .

The rest of this article is organized as follows. Section 2 gives brief Some preliminaries. Section 3 describes the

Formation of The Problem. Section 4 presents the implementation and validation of the algorithm with practical application. Finally, Section 6 presents the conclusion and proposals for future work.

2 Some preliminaries

Definition 1. [1] A real fuzzy number $\tilde{J}$ is a continuous fuzzy subset from the real line R whose triangular membership function $\mu_{\tilde{J}}(J)$ is defined by a continuous mapping from R to the closed interval [0,1], where

(1) $\mu_{\tilde{J}}(J)=0$ for all $J \in (-\infty, a_1]$,

(2) $\mu_{\tilde{J}}(J)$ is strictly increasing on $J \in [a_1, m]$,

(3) $\mu_{\tilde{J}}(J)=1$ for $J=m$,

(4) $\mu_{\tilde{J}}(J)$ is strictly decreasing on $J \in [m, a_2]$,

(5) $\mu_{\tilde{J}}(J)=0$ for all $J \in [a_2, +\infty)$.

This will be elicited by:

$$\mu_{\tilde{J}}(J)=\begin{cases} \dfrac{J-a_1}{m-a_1}, & a_1 \le J \le m, \\ \dfrac{a_2-J}{a_2-m}, & m \le J \le a_2, \\ 0, & otherwise. \end{cases} \quad (1)$$

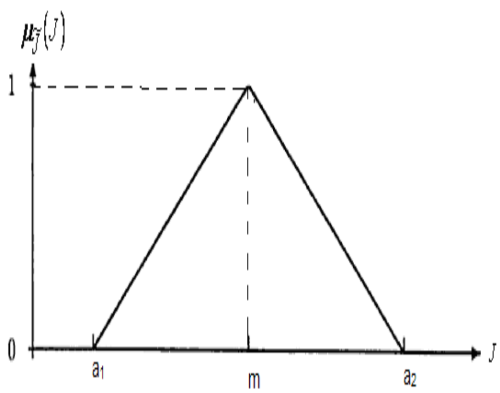

Figure 1: Membership Function of Fuzzy Number *J*.

where m is a given value a_1 and a_2 denote the lower and upper bounds. Sometimes, it is more convenient to use the notation explicitly highlighting the membership function parameters. In this case, we obtain

$$\mu(J; a_1, m, a_2) = \text{Max}\left\{\text{Min}\left[\frac{J-a_1}{m-a_1}, \frac{a_2-J}{a_2-m}\right], 0\right\} \quad (2)$$

In what follows, the definition of the α-level set or α-cut of the fuzzy number $\tilde{J}$ is introduced.

Definition 2. [1] Let $X = \{x_1, x_2, \ldots, x_n\}$ be a fixed non-empty universe, an intuitionistic fuzzy set IFS A in X is defined as

$$A = \{\langle x, \mu_A(x), \upsilon_A(x)\rangle | x \in X\} \quad (3)$$

which is characterized by a membership function $\mu_A : X \to [0,1]$ and a non-membership function

$\upsilon_A : X \to [0,1]$ with the condition $0 \le \mu_A(x) + \upsilon_A(x) \le 1$ for all $x \in X$ where μ_A and υ_A represent ,respectively, the degree of membership and non-membership of the element x to the set A. In addition, for each IFS A in X, $\pi_A(x) = 1 - \mu_A(x) - \upsilon_A(x)$ for all $x \in X$ is called the degree of hesitation of the element x to the set A . Especially, if $\pi_A(x) = 0,$, then the IFS A is degraded to a fuzzy set.

Definition 3. [4] The α-level set of the fuzzy parameters $\tilde{J}$ in problem (1) is defined as the ordinary set $L_\alpha(\tilde{J})$ for which the degree of membership function exceeds the level, α, $\alpha \in [0,1]$, where:

$$L_\alpha(\tilde{J}) = \{J \in R \,|\, \mu_{\tilde{J}}(J) \ge \alpha\} \quad (4)$$

For certain values α_j^* to be in the unit interval,

Definition 4. [10] Let X be a space of points (objects) and $x \in X$. A neutrosophic set A in X is defined by a truth-membership function $T_A(x)$, an indeterminacy-membership function $I_A(x)$ and a falsity-membership function $F_A(x)$. It has been shown in figure 2. $T_A(x)$, $I_A(x)$ and $F_A(x)$ are real standard or real nonstandard subsets of]0−,1+[. That is $T_A(x)$:X→]0−,1+[, $I_A(x)$:X→]0−,1+[and $F_A(x)$:X→]0−,1+[. There is not restriction on the sum of $T_A(x)$, $I_A(x)$ and $F_A(x)$, so 0−≤sup$T_A(x)$≤sup$I_A(x)$≤$F_A(x)$≤3+.

In the following, we adopt the notations $\mu_A(x)$, $\sigma_A(x)$ and $\upsilon_A(x)$ instead of $T_A(x)$, $I_A(x)$ and $F_A(x)$, respectively. Also we write SVN numbers instead of single valued neutrosophic numbers.

Definition 5. [10] Let X be a universe of discourse. A single valued neutrosophic set A over X is an object having the form

$A=\{\langle x, \mu_A(x), \sigma_A(x), \upsilon_A(x)\rangle : x \in X\}$

where $\mu_A(x)$:X→[0,1], $\sigma_A(x)$:X→[0,1] and $\upsilon_A(x)$:X→[0,1] with $0 \le \mu_A(x) + \sigma_A(x) + \upsilon_A(x) \le 3$ for all $x \in X$. The intervals $\mu_A(x)$, $\sigma_A(x)$ and $\upsilon_A(x)$ denote the truth- membership degree, the indeterminacy-

membership degree and the falsity membership degree of x to A, respectively.
For convenience, a SVN number is denoted by $A=(a,b,c)$, where $a,b,c\in[0,1]$ and $a+b+c\leq 3$.

Definition 6

Let $\tilde{J}$ be a neutrosophic number in the set of real numbers R, then its truth-membership function is defined as

$$T_{\tilde{J}}(J)=\begin{cases}\dfrac{J-a_1}{a_2-a_1}, & a_1\leq J\leq a_2,\\ \dfrac{a_2-J}{a_3-a_2}, & a_2\leq J\leq a_3,\\ 0, & otherwise.\end{cases} \tag{5}$$

its indeterminacy-membership function is defined as

$$I_{\tilde{J}}(J)=\begin{cases}\dfrac{J-b_1}{b_2-b_1}, & b_1\leq J\leq b_2,\\ \dfrac{b_2-J}{b_3-b_2}, & b_2\leq J\leq b_3,\\ 0, & otherwise.\end{cases} \tag{6}$$

and its falsity-membership function is defined as

$$F_{\tilde{J}}(J)=\begin{cases}\dfrac{J-c_1}{c_2-c_1}, & c_1\leq J\leq c_2,\\ \dfrac{c_2-J}{c_3-c_2}, & c_2\leq J\leq c_3,\\ 1, & otherwise.\end{cases} \tag{7}$$

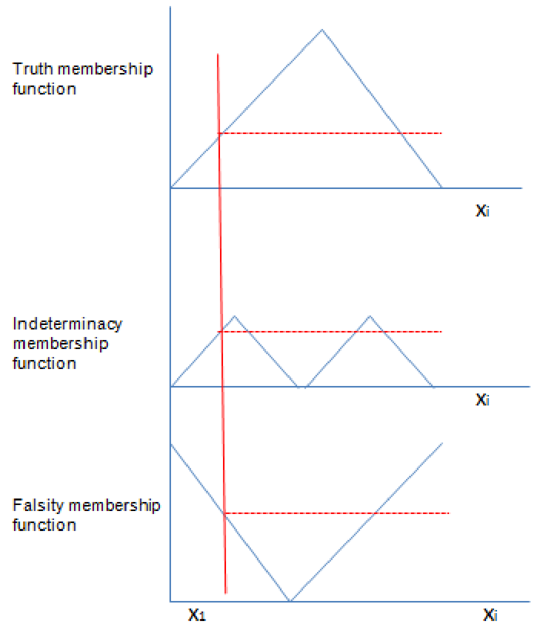

Figure 2: Neutrosophication process [11]

3 Formation of The Problem

The multi-objective linear programming problem and the multi- objective neutrosophic linear programming problem are described in this section.

A. Multi-objective Programming Problem (MOPP)

In this paper, the general mathematical model of the MLPP is as follows[6]:

$$\min/\max\ \left[z_1(x_1,\ldots,x_n), z_2(x_1,\ldots,x_n),\ldots,z_p(x_1,\ldots,x_n)\right] \tag{8}$$

$subject\ to\ \ x\in S, x\geq 0$

$$S=\left\{x\in R^n \,\middle|\, AX\begin{pmatrix}\leq\\=\\\geq\end{pmatrix}b,\quad X\geq 0.\right\} \tag{9}$$

B. Neutrosophic Multi-objective Programming Problem (NMOPP)

If an imprecise aspiration level is introduced to each of the objectives of MOPP, then these neutrosophic objectives are termed as neutrosophic goals.

Let $z_i\in\left[z_i^L, z_i^U\right]$ denote the imprecise lower and upper bounds respectively for the i^{th} neutrosophic objective function.

for maximizing objective function, the truth membership, Indeterminacy membership, falsity membership functions can be expressed as follows:

$$\mu_i^I(z_i)=\begin{cases}1, & if \quad z_i \ge z_i^U,\\ \dfrac{z_i-z_i^L}{z_i^U-z_i^L}, & if \quad z_i^L \le z_i \le z_i^U,\\ 0, & if \quad z_i \le z_i^L\end{cases} \quad (10)$$

$$\sigma_i^I(z_i)=\begin{cases}1, & if \quad z_i \ge z_i^U,\\ \dfrac{z_i-z_i^L}{z_i^U-z_i^L}, & if \quad z_i^L \le z_i \le z_i^U,\\ 0, & if \quad z_i \le z_i^L\end{cases} \quad (11)$$

$$\upsilon_i^I(z_i)=\begin{cases}0, & if \quad z_i \ge z_i^U,\\ \dfrac{z_i-z_i^L}{z_i^U-z_i^L}, & if \quad z_i^L \le z_i \le z_i^U,\\ 1, & if \quad z_i \le z_i^L\end{cases} \quad (12)$$

for minimizing objective function, the truth membership, Indeterminacy membership, falsity membership functions can be expressed as follows:

$$\mu_i^I(z_i)=\begin{cases}1, & if \quad z_i \le z_i^L,\\ \dfrac{z_i^U-z_i}{z_i^U-z_i^L}, & if \quad z_i^L \le z_i \le z_i^U,\\ 0, & if \quad z_i \ge z_i^U\end{cases} \quad (13)$$

$$\sigma_i^I(z_i)=\begin{cases}1, & if \quad z_i \le z_i^L,\\ \dfrac{z_i^U-z_i}{z_i^U-z_i^L}, & if \quad z_i^L \le z_i \le z_i^U,\\ 0, & if \quad z_i \ge z_i^U\end{cases} \quad (14)$$

$$\upsilon_i^I(z_i)=\begin{cases}0, & if \quad z_i \le z_i^L,\\ \dfrac{z_i^U-z_i}{z_i^U-z_i^L}, & if \quad z_i^L \le z_i \le z_i^U,\\ 1, & if \quad z_i \ge z_i^U\end{cases} \quad (15)$$

4 Algorithm for Neutrosophic Multi-Objective Programming Problem

The computational procedure and proposed algorithm of presented model is given as follows:

Step 1. Determine $x_i^*=\left(x_{i1}^*,x_{i2}^*,...,x_{in}^*\right)$ that is used to maximize or minimize the i^{th} truth membership function $\mu_i^I(X)$, the indeterminacy membership $\sigma_i^I(X)$, and the falsity membership functions $\upsilon_i^I(X)$. $i=1,2,..,p$ and n is the number of variables.

Step 2. Transform the truth membership, Indeterminacy membership, falsity membership functions by using first-order Taylor polynomial series

$$\mu_i^I(x)\cong\mu_i^I\left(x_i^*\right)+\sum_{j=1}^{n}\left(x_j-x_{ij}^*\right)\frac{\partial\mu_i^I\left(x_i^*\right)}{\partial x_j} \quad (16)$$

$$\sigma_i^I(x)\cong\sigma_i^I\left(x_i^*\right)+\sum_{j=1}^{n}\left(x_j-x_{ij}^*\right)\frac{\partial\sigma_i^I\left(x_i^*\right)}{\partial x_j} \quad (17)$$

$$\upsilon_i^I(x)\cong\upsilon_i^I\left(x_i^*\right)+\sum_{j=1}^{n}\left(x_j-x_{ij}^*\right)\frac{\partial\upsilon_i^I\left(x_i^*\right)}{\partial x_j} \quad (18)$$

Step 3. Find satisfactory $x_i^*=\left(x_{i1}^*,x_{i2}^*,...,x_{in}^*\right)$ by solving the reduced problem to a single objective for the truth membership, Indeterminacy membership, falsity membership functions respectively.

$$\begin{aligned}p(x)&=\sum_{i=1}^{p}\left[\mu_i^I\left(x_i^*\right)+\sum_{j=1}^{n}\left(x_j-x_{ij}^*\right)\frac{\partial\mu_i^I\left(x_i^*\right)}{\partial x_j}\right]\\ q(x)&=\sum_{i=1}^{p}\left[\sigma_i^I\left(x_i^*\right)+\sum_{j=1}^{n}\left(x_j-x_{ij}^*\right)\frac{\partial\sigma_i^I\left(x_i^*\right)}{\partial x_j}\right]\\ h(x)&=\sum_{i=1}^{p}\left[\upsilon_i^I\left(x_i^*\right)+\sum_{j=1}^{n}\left(x_j-x_{ij}^*\right)\frac{\partial\upsilon_i^I\left(x_i^*\right)}{\partial x_j}\right]\end{aligned} \quad (19)$$

Thus neutrosophic multiobjective linear programming problem is converted into a new mathematical model and is given below:

Maximize or Minimize *p(x)*

Maximize or Minimize *q(x)*

Maximize or Minimize *h(x)*

Where $\mu_i^I(X)$, $\sigma_i^I(X)$ and $\upsilon_i^I(X)$ calculate using equations (10), (11), and (12) or equations (13), (14), and (15) according to type functions maximum or minimum respectively.

4.1 Illustrative Example

A multi-criteria supplier selection is selected from [2]. For supplying a new product to a market assume that three suppliers should be managed. The purchasing criteria are net price, quality and service. The capacity constraints of suppliers are also considered.

It is assumed that the input data from suppliers' performance on these criteria are not known precisely. The neutrosophic values of their cost, quality and service level are presented in Table 1.

The multi-objective linear formulation of numerical example is presented as min z_1, max z_2, z_3:

$$\begin{aligned}
&\min\ z_1 = 5x_1 + 7x_2 + 4x_3,\\
&\max\ z_2 = 0.80x_1 + 0.90x_2 + 0.85x_3,\\
&\max\ z_3 = 0.90x_1 + 0.80x_2 + 0.85x_3,\\
&s.t.:\\
&x_1 + x_2 + x_3 = 800,\\
&x_1 \le 400,\\
&x_2 \le 450,\\
&x_3 \le 450,\\
&x_i \ge 0,\ i = 1,2,3.
\end{aligned}$$

Table 1: Suppliers quantitative information

	Z1 Cost	Z2Quality (%)	Z3 Service (%)	Capacity
Supplier 1	5	0.80	0.90	400
Supplier 2	7	0.90	0.80	450
Supplier 3	4	0.85	0.85	450

The truth membership, Indeterminacy membership, falsity membership functions were considered to be neutrosophic triangular. When they depend on three scalar parameters (a1,m,a2). z_1 depends on neutrosophic aspiration levels (3550,4225,4900), when z_2 depends neutrosophic aspiration levels (660,681.5,702.5), and z3 depends neutrosophic aspiration levels (657.5,678.75,700).

The truth membership functions of the goals are obtained as follows:

$$\mu_1^I(z_1)=\begin{cases}0, & if \quad z_1 \le 3550,\\ \dfrac{4225-z_1}{4225-3550}, & if \quad 3550 \le z_1 \le 4225,\\ \dfrac{4900-z_1}{4900-4225}, & if \quad 4225 \le z_1 \le 4900,\\ 0, & if \quad z_1 \ge 4900\end{cases}$$

$$\mu_2^I(z_2)=\begin{cases}0, & if \quad z_2 \ge 702.5,\\ \dfrac{z_2-681.5}{702.5-681.5}, & if \quad 681.5 \le z_2 \le 702.5,\\ \dfrac{z_2-660}{681.5-660}, & if \quad 660 \le z_2 \le 681.5,\\ 0, & if \quad z_2 \le 660.\end{cases}$$

$$\mu_3^I(z_3)=\begin{cases}0, & if \quad z_3 \ge 700,\\ \dfrac{z_3-678.75}{700-678.75}, & if \quad 678.75 \le z_3 \le 700,\\ \dfrac{z_3-657.5}{678.75-657.5}, & if \quad 657.5 \le z_3 \le 678.75,\\ 0, & if \quad z_3 \le 657.5.\end{cases}$$

If

$$\mu_1^I(z_1)=\max\left(\min\left(\frac{4225-(5x_1+7x_2+4x_3)}{675},\frac{4900-(5x_1+7x_2+4x_3)}{675},0\right)\right)$$

$$\mu_2^I(z_2)=\min(\max(\frac{(0.8x_1+0.9x_2+0.85x_3)-681.5}{21},\frac{(0.8x_1+0.9x_2+0.85x_3)-660}{21},1))$$

$$\mu_3^I(z_3)=\min(\max(\frac{(0.9x_1+0.8x_2+0.85x_3)-678.75}{21.25},\frac{(0.9x_1+0.8x_2+0.85x_3)-657.5}{21.25},1))$$

Then

$\mu_1^{I*}(350,0,450)$, $\mu_2^{I*}(0,450,350)$, $\mu_3^{I*}(400,0,400)$

The truth membership functions are transformed by using first-order Taylor polynomial series

$$\hat{\mu}_1^I(x)=\mu_1^I(350,0,450)+\left[(x_1-350)\frac{\partial\mu_1^I(350,0,450)}{\partial x_1}\right]+\left[(x_2-0)\frac{\partial\mu_1^I(350,0,450)}{\partial x_2}\right]+\left[(x_3-450)\frac{\partial\mu_1^I(350,0,450)}{\partial x_3}\right]$$

$$\hat{\mu}_1^I(x) \cong -0.00741x_1-0.0104x_2-0.00593x_3+5.2611$$

In the similar way, we get

$$\hat{\mu}_2^I(x) \cong 0.0381x_1+0.0429x_2+0.0405x_3-33.405$$

$$\hat{\mu}_3^I(x) \cong 0.042x_1+0.037x_2+0.0395x_3-32.512$$

The the p(x) is

$$p(x)=\hat{\mu}_1^I(x)+\hat{\mu}_2^I(x)+\hat{\mu}_3^I(x)$$

$$p(x) \cong 0.07259x_1+0.0695x_2+0.0741x_3-60.6559$$

$$\begin{aligned}
&s.t.:\\
&x_1 + x_2 + x_3 = 800,\\
&x_1 \le 400,\\
&x_2 \le 450,\\
&x_3 \le 450,\\
&x_i \ge 0,\ i = 1,2,3.
\end{aligned}$$

The linear programming software LINGO 15.0 is used to solve this problem. The problem is solved and the optimal solution for the truth membership model is obtained is as follows: (x_1, x_2, x_3) = (350,0,450) z_1=3550, z_2=662. 5, z_3=697. 5.

The truth membership values are $\mu_1 = 1$, $\mu_2 = 0.1163$, $\mu_3 = 0.894$. The truth membership function values show that both goals z_1 , $z_3$and z_2 are satisfied with 100% , 11.63% and 89.4% respectively for the obtained solution which is x1=350; x2= 0, x3=450.

In the similar way, we get $\sigma_i^I(X)$, $q(x)$ Consequently we get the optimal solution for the Indeterminacy membership model is obtained is as follows: (x_1,x_2,x_3)=(350,0,450) z_1=3550, z_2=662.5, z_3=697.5

and the Indeterminacy membership values are $\mu_1 = 1$, $\mu_2 = 0.1163$, $\mu_3 = 0.894$. The Indeterminacy membership function values show that both goals z_1, $z_3$and z_2 are satisfied with 100% , 11.63% and 89.4% respectively for the obtained solution which is $x1=350$; $x2= 0$, x3=450.

In the similar way, we get $\upsilon_i^I(X)$ *and h(x)* Consequently we get the optimal solution for the falsity membership model is obtained is as follows: $(x_1,x_2,x_3)=(350,0,450)$ $z_1=3550$, $z_2=662.5$, $z_3=697.5$ and the falsity membership values are $\mu_1 = 0$, $\mu_2 = 0.8837$, $\mu_3 = 0.106$. The falsity membership function values show that both goals z_1, $z_3$and z_2 are satisfied with 0% , 88.37% and 10.6% respectively for the obtained solution which is $x1=350$; $x2= 0$, x3=450.

5 Conclusions and Future Work

In this paper, we have proposed a solution to Multiobjective programming problem (NMOPP). The truth membership, Indeterminacy membership, falsity membership functions associated with each objective of the problem are transformed by using the first order Taylor polynomial series. The neutrosophic multi-objective programming problem is reduced to an equivalent multiobjective programming problem by the proposed method. The solution obtained from this method is very near to the solution of MOPP. Hence this method gives a more accurate solution as compare to other methods. Therefore the complexity in solving NMOPP, has reduced to easy computation. In the future studies, the proposed algorithm can be solved by metaheuristic algorithms.
