The hypothesis of the reason of a polarity reversal of magnetic field of Earth as result of the relative movement of a cloak and bark is made

Today there is no uniform and finished theory of magnetism and the nature of emergence of objects of the Universe. The majority of theories is based on "wandering and circular" currents or mystical magnetic particles, and without any logical explanations from where and how they appear. Also there is no consensus about "carrier" and the movement of magnetic field.

It is supposed that magnetic field of Earth is a consequence of a difference of speeds of rotation of bark and a cloak (1). Perhaps, in this case there are fading periodic fluctuations of speed of rotation of a cloak concerning bark (it is more – less) (2), as causes a polarity reversal of magnetic field of Earth! Therefore disappearance of magnetic field of Earth is inevitable, and existence of weak magnetic field of planets indicates lack of geothermal activity.
