

Belief

There are some who believe that a god created man 4000 years ago.

In that case this would mean that this god would have to not only design the human genome, but also that of all life forms on Earth, rather a difficult task.

Unbelievable.

But perhaps those theists that accept a bit of science, such as carbon dating, will suppose that a few billion years ago their particular god created the very primitive life form, that has been discovered recently, as being that from which all life today has evolved.

Unbelievable.

And this on a almost infinitely tiny speck of dust, in a universe that is of literally unbelievable dimensions.

But some scientists also believe that a god created man.

Now this is a problem for these believers, as science is supposed to be based upon empirical evidence, and on such evidence alone.

This being the case then such scientists, who are programmed by their upbringing into believing in a god, are susceptible to believing in things that are not based upon concrete, verifiable evidence.

Which, incidentally, is in fact the situation today for theoretical physicists in general, as they believe in the unbelievable constructs of relativistic and quantum mechanical dogma, and, I have to add, in the 'existence' of non-existence.

Unbelievable.

Conclusion – theoretical physics today is a cult, even a religion, and not a science.
