Начала нет и нет конца,
Михаил Танич*

Rings of Saturn are a consequence of the climatic climate changes of Solar system caused by her movement in the galaxy and the galaxy in the Universe.

Hypothesis: the cause of climatic rings of Saturn and annual rings of trees – same.

Rings of Saturn – the system of flat concentric educations from ice and dust which is located in the equatorial plane of Saturn (fig. 1).

(говорят о безупречно выполненном деле)*

In a question of my granddaughter: "The grandfather, and Jupiter has grown from the earth too?", perhaps, the answer to the greatest riddle of Solar system sounds. Watch attentively fig. 2!

Every year with a growth of a tree in him the external layer of wood in the form of a ring appears. Such education is called an annual growth ring. If to count their number, then it is possible to learn age of a tree precisely. Each annual growth ring is formed by two parts: an internal part of a ring – a light and friable and external part – more dark and dense. These parts of the same ring differ with time of their education: light – spring and summer; dark – autumn. The similar type of year layers of a tree is characteristic only of a midland. In the winter trees don't grow in our climate therefore they has non-uniform structure (fig. 2).
