

972 Stars in Different Stages of Metamorphosis

Jeffrey J. Wolynski
October 6, 2018
Rockledge, FL 32955

Abstract: A simple graph is provided on log₁₀ scale for masses that young hot stars become colder older smaller stars, mislabeled "planets/brown dwarfs/exoplanets" by the establishment. The data is freely available online and is sourced in this paper.

The graph is self-explanatory, stars lose mass and shrink on a continuous basis, becoming life hosting worlds to the bottom left, after billions of years of evolutionary sequences. The radii and masses of the stars are referenced against Jupiter, as Jupiter is a good middle ground star just exiting its brown dwarf stages of evolution, but not too evolved as to host life as of yet. This graph will be strengthened more when the TESS data comes back, and the author includes even more brown dwarfs that are already directly observed. I can't remember who said it, but the authority of 10,000 is no match against the simple reasoning of a single individual. The book of stellar metamorphosis:
