

if you had an elastic ball and a nonelastic ball you could call these two forms of masses as the activity of a mass this is a new quality now the other two stuff that describes what we are talking about here is the force and the masses of the two masses these are literally the three stuff that exist in the universe the force the masses weight and the quality of the mass and these are the arbitrary values inside a polynomial of the third degree and since there are no other stuff that exist within the universe we could say that there is no polynomial of the fourth degrees values solution
