### Abstract

The short writing seeks to demonstrate certain lapses in the theory of the linear vector spaces.

### Introduction

We set out to bring out a contradiction in the theory of the linear vector spaces.

### Basic Calculations

We consider  $V$ , a linear vector space<sup>[1]</sup>.  $W$  is a proper subspace<sup>[2]</sup>:  $W \subset V$ . We take  $e \in V - W$  and  $N$  vectors  $y_i \in W$ ;  $i = 1, 2, 3 \dots N \gg n = \dim V$ . All  $y_i$  are not linearly independent. We consider  $k = \dim W$  of the  $y_i \in W$  as linearly independent. They form a basis of  $W$ . The rest of the  $y_i$  are linear combinations of the basic vectors of  $W$ .

We form the sums

$$\alpha_i = e + y_i; i = 1, 2, 3 \dots N$$

$$\alpha_i \in V - W$$

Next we consider the equation

$$\sum_i c_i \alpha_i = 0 \quad (1)$$

$$\sum_i c_i (e + y_i) = 0$$

$$\Rightarrow e \sum_i c_i = \sum_i c_i y_i \quad (2)$$

The right side of (1) belongs to  $W$  while the left side belongs to  $V - W$

This is not possible unless each side of ... is equal to zero. We cannot have all  $c_i = 0$  since that will produce  $N$  linearly independent vectors with  $N \gg n = \dim V$ .

Equations:

$$\sum c_i = 0; i = 1, 2, \dots, N \quad (3.1)$$

$$\sum_i c_i y_i = 0; i = 1, 2, 3 \dots N \quad (3.2)$$

Equation  $\sum c_i = 0$  implies  $c_N = -c_1 - c_2 - \dots - c_{N-1}$

Using the above result in (3.2) we obtain,

$$y_N = \frac{c_1}{c_1 + c_2 + \dots + c_{N-1}} y_1 + \frac{c_2}{c_1 + c_2 + \dots + c_{N-1}} y_2 + \dots + \frac{c_{N-1}}{c_1 + c_2 + \dots + c_{N-1}} y_{N-1} \quad (13)$$

$$y_N = a_1 y_1 + a_2 y_2 + a_3 y_3 + \dots + a_{N-1} y_{N-1} \quad (4)$$

where  $a_i = \frac{c_i}{c_1 + c_2 + \dots + c_{N-1}}; i = 1, 2, 3 \dots N - 1$

It is important to take note of the fact that with (4)

$$a_1 + a_2 + \dots + a_{N-1} = 1 \quad (5)$$

But  $y_N$  could be an arbitrary superposition of the rest of  $y_i$ , according to our choice. Constraint given by (5) is quite unwarranted. We may exert our choice in order to have  $y_N$  with

$$a_1 + a_2 + \dots + a_{N-1} \neq 1 \quad (6)$$

### Conclusions

As claimed at the outset, there are contradictions in the theory of the linear vector spaces. A restructuring of the subject could be necessary
