

A Strange Connection Exists Between Middlebush, NJ and the Sunken Locomotives Off Long Branch, NJ

George R. Briggs

Abstract: The 44.6 mile distance between Middlebush NJ and the 2 sunken early type locomotives found 5 miles off the coast of NJ near Long Branch NJ indicate an important connection between Middlebush and the MHCE8S theory of the universe.

In a previous note¹ I discussed how important the 4 numbers 0.511, 15.5, 1.55 and 155 have been in the MHCE8S theory of the universe. More recently I have noticed that a seeming connection can be made between 155 minus 11 (11 is **nature's important action number**) = $144/2 = 72$ and $44.6 \times 1.609344 = 71.776742$ Km. The ratio (**nature's method of comparison**) = $72/71.77642 = 1.0031149$, which indicates a very close match. Now my father as an immigrant baby in 1881 (his mother died in childbirth) lived with a couple from Middlebush for several years before settling in Brooklyn, NY. I am looking forward with anticipation to reading any inscriptions found on the hopefully raised and eventually restored locomotives.
