

# RELATIVITY REFUTED

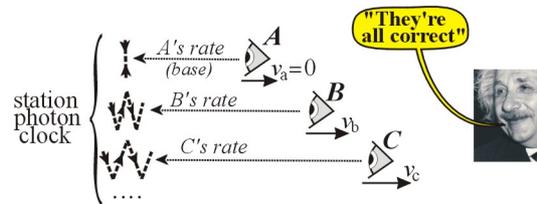

in four short sentences

## ABSTRACT

1) In his station and truck observer thought exercise, Einstein shows that an observer moving inertially relative to a photon clock sees it ticking slower than his own. 2) Different inertial observers, travelling at different relative speeds, each see the clock running at a different rate. 3) The first SR postulate says all their views are correct. 4) This being absurd, so on the 'reductio ad absurdum' principle is Special Relativity itself.
