

Title : A new discovery

Abstract : A new discovery related to our body weight and its muscles strength compared to normal calculations.

Author : Yahya A.Sharif

I can lift my whole body " 60kg" with my feet , but I can't lift a 60kg mass with my whole body.

Explanation :

The muscles have the strength that can be measured by a scale. but when the mass which is lifted is my body the muscles can lift it with strength less than its weight , it is obviously that it is related to construction of the body , that is, muscles being part of the body it lift.

Mathematically we could measure the ratio between the muscles strength lifting a mass and the muscles strength lifting the body .The body weight and the mass weight must be equal "measured by a scale.

As a result of this free energy could be extracted by a person climbing a ladder and falling on a generator turbine.
